

AI Grooming Assistant - Performance & Stress Test Report

Sections 6.8 (Performance Results) and 6.9 (Stress Testing)

Generated 2026-09-24 03:38 from performance_results.txt and stress_test_log.txt, both produced by performance_logger.py running alongside main.py.

6.8 Performance Results

Measured over a live session of 37 seconds (9 logged snapshots, saved by pressing 'L' while main.py was running).

Metric	Min	Avg	Max
FPS	27.0	27.7	28.6
CNN inference time (ms)	72.1	73.1	73.6
Memory / RSS (MB)	536.5	540.3	545.8

Analysis-to-lock time (~30-frame average, time from a face first being analyzed to the CNN result locking): 6585 ms, 6832 ms across 2 lock event(s) observed in this session.

This session was short (under a minute) and only covers ordinary use, not the 30-minute long-run stability case from Section 6.9. Run performance_logger.py for a longer session and press 'L' again before finalizing these numbers, and/or average across several runs.

6.9 Stress Testing

Seven manual test cases, logged in stress_test_log.txt.

#	Case	Result	Notes
	No face in view -> should not crash, should show a prompt	PENDING	-
2			
3			Very d or stay
4			Two faces in
5			Rapid key presses (p
6			Long run, about 30 minutes
7			Model files removed/renamed -> a mode with a visible badge

One or more cases above are still PENDING - stress_test_log.txt has not been fully filled in yet. Work through each case with main.py running, write PASS or FAIL and a short note in stress_test_log.txt, then regenerate this report.
